Application US/08982785A
Patent No. 6258929
GENERAL INFORMATION:
APPLICANT: Kosik, Kenneth S.
APPLICANT: Zhou, Jianhua
TITLE OF INVENTION: ALARM RELATED PEPTIDES AND
TITLE OF INVENTION: NUCLEIC ACIDS AND DIAGNOSIS USING THEM
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
ADDRESSEE: Fish & Richardson P.C.
STREET: 225 Franklin Street

Patent No. 5981246
GENERAL INFORMATION:
APPLICANT: FOX, Gary M.
TITLE OF INVENTION: EPH-Like Receptor Protein Tyrosine
TITLE OF INVENTION: Kinases
NUMBER OF SEQUENCES: 43
CORRESPONDENCES: A3
ADDRESSEE: Amgen Patent Operations/RBW
                                                                                                                                                                               COMPUTER FEADABLE FORM:

Biochem. Biophys. Res. Commun. 211:566-589(1995).

Fischem. Biophys. Res. Commun. 211:566-589(1995).

FUNCTION: MAY CATALYZE THE DECRADATION OF INTERCELLULAR COHESIVE STRUCTIORS IN THE CONTINUOUS SHEDDING OF CELLS FROM THE SKIN SURFACE. SPECIFIC FOR AMINO ACID RESIDUES WITH AROMATIC SIDE CHAINS IN THE P! POSITION. SCCE CLEAVES INSULIN B CHAIN AT 6-LEU-1-CYS-7, 16-TYR-1-LEU-17, 25-PHE-1-TYR-26, AND 26-TYR-1-THR-27. COULD PLAY A ROLE IN THE ACTIVATION OF PRECURSORS TO INFLAMMATORY CYTOKINES.

FINESSUE SPECIFICITY: IT IS ABUNDANTLY EXPRESSED IN THE SKIN AND IS EXPRESSED BY KERATINOCYTES IN THE EPIDERMIS. VERY LOW LEVELS ARE ALSO SEEN IN THE BRAIN AND KIDNEY.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hansson L., Stroemqvist M., Baeckman A., Wallbrandt P., Carlstein A., Egelrud T.;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Skytt A., Stroemqvist M., Egelrud T.; "Primary substrate specificity of recombinant human stratum corneum

-!- FUNCTION: ABSOLUTELY REQUIRED FOR SIMIAN VIRUS 40 DNA REPLICATION
IN VITRO. IT PARTICIPATES IN A VERY EARLY STEP IN INITIATION. RP-A
IS A SINGLE-STRANDED DNA-BINDING PROTEIN (BY SIMILARITY).
-!- SUBUNIT: HETEROTRIMER OF 70, 32/30, AND 14 kDa CHAINS. THE DNA-
BINDING ACTIVITY MAY RESIDE EXCLUSIVELY ON THE 70 kDa SUBUNIT.
                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

            Biochem. J. 304:833-841(1994).

-!- PUNCTION: MAY COMPRIBUTE TO THE RAPID MOTILITY OF THE
TRYPANOSOMES, PLAYING A ROLE EITHER IN FLACELLAR STRUCTURE OR IN
CALCIUM METABOLISM. COULD ALTERNATE BETWEEN A GDP-BOUND INACTIVE
FORM TO A CALCIUM/GTP-BOUND ACTIVE FORM.
-!- SUBCELLULAR LOCATION: FLAGELLUM.
-!- DOMAIN: THIS PROTEIN HAS 8 EF-HAND DOMAINS, 6 OF WHICH MAY BE
FUNCTIONAL CALCIUM-BINDING SITES.
-!- SIMILARITY: BELONGS TO THE EF-HAND CALCIUM BINDING PROTEIN
SUPERFAMILY; CALFLAGIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

"Nucleotide sequence of the tetM tetracycline resistance determinant
of the streptococcal conjugative shuttle transposon Tn1545.";
Nucleic Acids Res. 14:704.7058(1986).
-!- FUNCTION: ABOLISH THE INHIBITORY EFFECT OF TETRACYCLIN ON PROTEIN
SYNTHESIS BY A NON-COVALENT MODIFICATION OF THE RIBOSOMES.
-!- SIMILARITY: BELONGS TO THE GTP-BINDING ELONGATION FACTOR FAMILY.
TETM/TETO SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                               SUBMITTED (JAN-1996) to the EMBL/GenBank/DDBJ databases.

-! FUNCTION: THE COATOMER IS A CYTOSOLIC PROTEIN COMPLEX THAT BINDS
-! FUNCTION: THE COATOMER IS A CYTOSOLIC PROTEIN COMPLEX THAT
TO DILYSINE MOTIFS AND REVERSIBLY ASSOCIATES WITH GOLGI NON-
CLATHRIN-COATED VESICLES, WHICH FUNTHER MEDIATE BLOSYWHHETIC
PROTEIN TRANSPORT FROM THE ER, VIA THE GOLGI UP TO THE TRANS
NETWORK. COATOMER COMPLEX IS REQUIRED FOR BUDDING FROM GOLGI
MEMBRANES, AND IS ESSENTIAL FOR THE RETROGRADE GOLGI-TO-ER
TRANSPORT OF DILYSINE-TAGGED PROTEINS (BY SIMILARITY).

-! SUBUNIT: OLICOMERIC COMPLEX THAT CONSISTS OF AT LEAST THE ALPHA,
SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBCELLULAR LOCATION: THE COATOMER IS CYTOPLASMIC OR POLYMERIZED ON THE CYTOPLASMIC SIDE OF THE GOLGI, AS WELL AS ON THE VESICLES/RUDS ORIGINATING FROM IT (BY SIMILARITY).
SIMILARITY: BELONGS TO THE COPG FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
